

GMD: export recovery meets scarce port capacity

A top-down initiation from Vietnam trade and FDI to container throughput, attributable earnings and valuation.

BUY

Target VND 84,500

15.4% upside

The Base case only narrowly clears the BUY hurdle; execution risk is material.

Trade is accelerating, but TEU conversion is the investable link

Vietnam's merchandise trade reached USD 930bn in 2025; 1H2026 growth strengthened further. The model therefore forecasts physical container growth below headline trade-value growth.

+27.1%

1H2026 total trade YoY

+11.2%

1H2026 disbursed FDI YoY

34m TEU

2025 national container anchor

*Model discipline: trade value supports the backdrop;
national TEU is forecast separately.*

GMD earns the modeling focus on assets, runway and disclosure

A weighted operating screen ranks business quality before valuation. GMD leads, while PHP remains the strategic asset benchmark and VSC the primary competitive comparator.

Why GMD leads

- Nationwide network with Gemalink deep-sea exposure and completed Nam Dinh Vu Phase 3.
- 2025 system throughput reached 5.079m TEU, up 15% with about 15% national share.
- Best operating disclosure in the peer set supports a driver-based, auditable model.

Selection is operational, not automatic valuation superiority.

2021-2025: throughput doubled as associates scaled

Historical earnings support the operating thesis, but consolidated revenue alone understates Gemalink because it is equity-accounted.

Base case: share gains and lower capex lift cash conversion

The forecast is built from national TEU growth, GMD share and unit/mix assumptions before flowing into revenue, earnings and FCFF.

5.7m

2026E GMD throughput (+11.9%)

8.5m

2030E GMD throughput

2,661

2030E FCFF, VND bn

Key assumptions: 10% national TEU growth and 15.2% share in 2026; Gemalink profit steps up from 2028.

VND 84,500 target gives 15.4% upside - just above the BUY hurdle

The primary call blends a 2026E P/E valuation with a DCF/SOTP cross-check. Scenario dispersion is wide because terminal assumptions and execution both matter.

Valuation bridge

Method / output	VND/share
2026E P/E implied	79,693
DCF/SOTP implied	88,988
Blended value	84,341
Rounded target	84,500

DCF sensitivity (VND/share)

WACC / TGR	3.5%	4.0%	4.5%
11.0%	90,844	94,758	99,274
11.5%	86,381	89,744	93,588
12.0%	82,449	85,364	88,668

Probability-weighted target: VND 84,000 (14.8% upside).

The BUY works only if new capacity converts into share and cash

The thesis is testable. Each catalyst has a leading indicator, and each downside has an explicit model stress.

Catalysts

- 2026 trade and FDI backdrop supports national container demand.
- Nam Dinh Vu Phase 3 contributes for a full year and lifts Northern route flexibility.
- Gemalink Phase 2 commissioning from Q4 2027 raises equity-accounted earnings from 2028.
- Service and cargo mix lift implied revenue per system TEU by 2.5%-3.0% annually.

Falsifiers and downside triggers

- National TEU growth falls below 5% despite stronger trade value.
- GMD share drops below 14.8% as competing capacity absorbs sector growth.
- Gemalink Phase 2 slips beyond Q4 2027 or ramps below plan.
- Capex stays above VND 1.5tn and NCI leakage prevents parent cash conversion.

Conclusion: BUY, target VND 84,500, 15.4% upside - but with limited margin of safety and a Bear value of VND 51,000.
